DRILLING COMMENCES AT HAYES CREEK PROJECT

- Initial 1,000m diamond drill program has commenced at Iron Blow and Mount Bonnie
- The aim of this initial drill program is to define new mineralised positions, build confidence in grade continuity, and obtain samples for metallurgical test work
- Downhole electromagnetic survey to follow drilling to identify potential new massive sulphide zones in addition to those already known
- Regional exploration has also commenced to investigate a number of promising base metals targets within the Hayes Creek project area

Phoenix Copper Limited (ASX: PNX) is pleased to announce that drilling has commenced at the Hayes Creek Project in the Pine Creek region of the Northern Territory (Figure 1). The drill program will comprise 1,000 metres of diamond drilling (4 holes) targeting the Iron Blow and Mount Bonnie deposits (Figures 2 and 3, and Table 1).

The recent successful capital raising has enabled this initial drill program to commence prior to the onset of the wet season.

The primary objectives of the drill program are to define new mineralised zones, obtain samples for metallurgical test work, build confidence in grade continuity within the existing resource and to undertake down hole electromagnetic (EM) surveys.

Previous drilling (Figures 2 and 3) at Iron Blow (IB) and Mount Bonnie (MB) returned1:
- IBDH007 – 20.3m @ 5.89g/t Au, 481.6g/t Ag, 13.92% Zn, 3.10% Pb and 0.61% Cu from 193m
- MBDH001 – 9.6m @ 2.55g/t Au, 312g/t Ag, 13.16% Zn, 3.47% Pb and 0.65% Cu from 75.2m

An Inferred Mineral Resource Estimate (reported in accordance with 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves) was recently completed for the Iron Blow deposit (Table 2).

CEO Comment

The CEO of Phoenix Copper James Fox said, “We are excited to be on the ground drilling and undertaking fieldwork at the Hayes Creek Project. Excellent potential exists at Iron Blow and Mount Bonnie to define new mineralised positions near to the existing high-grade mineralisation. We will also undertake downhole and detailed surface EM to target new areas of massive sulphide mineralisation. Obtaining samples for metallurgical testwork will also allow a flotation program to commence shortly.”

The drill program is expected to take approximately 4 weeks to complete and assays should be available in late January 2015.

**Table 2:** Iron Blow Inferred Mineral Resource Estimate as at 8th October 2014. See ASX release 3 November 2014, ‘High Grade Mineral Resource Estimate for Iron Blow Deposit’, where further details are provided. Note there has been no material change in the Mineral Resource Estimate since it was first reported.
Competent Person's Statement

The information in this report that relates to Exploration Results is based on information compiled by Mr Ian Garsed, a Competent Person who is a Member of the Australian Institute of Geoscientists and a consultant to the company. Mr Garsed has sufficient experience relevant to the style of mineralisation and the type of deposits under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves”. Mr Garsed consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.
